

Cowry Pouches — Replit Setup

This package adds the full **Pouches creation flow** to your React app on Replit. When users tap “Open a pouch” on the home screen, this 5-screen flow takes over.

What’s included

- `PouchIcon.jsx` — the locked Cowry pouch icon (line drawing with cowry mark) as a reusable SVG component
- `CreatePouchFlow.jsx` — the 5-screen creation flow with all state management
- `CreatePouchFlow.css` — styling for the creation flow
- `App-with-pouches.jsx` — example of how to wire everything together

Setup in 4 steps

1. Add the files

In your Replit project, navigate to `src/components/` and upload all four:

- `PouchIcon.jsx`
- `CreatePouchFlow.jsx`
- `CreatePouchFlow.css`

(The CSS is automatically imported by the JSX, so as long as they’re in the same folder, you’re good.)

2. Confirm Fraunces is loaded

The flow uses Fraunces for headlines. If you’ve already added it for the splash or home screen, skip this. Otherwise, in your `index.html` `<head>`:

```
<link href="https://fonts.googleapis.com/css2?family=Fraunces:opsz,wght@9..144,30
```

3. Wire it into App.jsx

Use `App-with-pouches.jsx` as your reference. The key parts:

```

import { useState } from 'react';
import HomeScreen from '../components/HomeScreen';
import CreatePouchFlow from '../components/CreatePouchFlow';

export default function App() {
  const [creatingPouch, setCreatingPouch] = useState(false);
  const [pouches, setPouches] = useState([]);

  return (
    <>
      <HomeScreen
        pouches={pouches}
        onCreatePouch={() => setCreatingPouch(true)}
      />

      {creatingPouch && (
        <CreatePouchFlow
          onComplete={(newPouch) => {
            setPouches([...pouches, newPouch]);
            setCreatingPouch(false);
          }}
          onCancel={() => setCreatingPouch(false)}
        />
      )}
    </>
  );
}

```

4. Run it

Hit **Run** in Replit. On the home screen, swipe to the Pouches card and tap “Open a pouch.” The 5-screen flow should appear.

The 5 screens

1. **Welcome splash** — the pouch icon, “Let’s open a pouch.”, “Get started” button
2. **Pick an icon** — 12 category icons (Savings, Travel, Rainy day, Gift, Birthday, Wedding, School, Family, Home, Car, Faith, Custom)
3. **Name your pouch** — text input with smart suggestions based on the category picked
4. **Set a goal (optional)** — toggle for whether to add a goal, dollar amount input, live preview

5. **Success splash** — dark green vault background with confetti, “Your pouch is open.” headline, preview card, “Add money to it” CTA

What the flow returns

When the user finishes, `onComplete` is called with the new pouch object:

```
{
  name: "Mama's hospital",    // what they typed
  emoji: '🏥',                // selected category emoji
  category: 'family',        // selected category id
  saved: 0,                  // always starts at 0
  goal: 2000,                // null if they skipped the goal step
  currency: 'USD',
}
```

You add this to your pouches list and pass it into `<HomeScreen pouches={...} />`.

Customizing the categories

The 12 categories are defined at the top of `CreatePouchFlow.jsx` in the `POUCH_CATEGORIES` array. Each one has:

```
{
  id: 'travel',              // unique id
  emoji: '✈️',               // displayed in the grid and on the pouch
  label: 'Travel',          // shown under the emoji
  suggestions: [            // shown on the name screen as tappable chips
    'Trip home',
    'Visit Mama',
    'Summer trip',
  ],
}
```

To add or change categories, edit that array. Make sure `id` is unique and `suggestions` is an array (can be empty for “Custom”).

Customizing the icon

The pouch icon itself lives in `PouchIcon.jsx`. It’s a single SVG component you can use anywhere:

```
<PouchIcon size={48} />
<PouchIcon size={120} stroke="#1a2e22" accent="#c9a04a" />
<PouchIcon size={140} stroke="#f5ebd6" accent="#c9a04a" /> // for dark backgroun
```

The success screen uses the cream-colored version automatically.

Behavior notes

- The flow is a **full-screen overlay** (z-index 1000) that sits on top of the home screen
- **Back button** on each step goes back to the previous step. On step 1, it cancels.
- **Continue button** is disabled until the user has made the required selection
- **Smart defaults:** when a user picks an icon, the first suggestion auto-fills the name field
- **The goal step is fully optional** — there's a "Skip" button that takes them straight to success
- **Success splash uses the dark green Cowry vault color** as a brand callback to the splash and login

Replit Agent prompt

If you want the agent to install this for you:

```
I uploaded PouchIcon.jsx, CreatePouchFlow.jsx, and CreatePouchFlow.css to
src/components/. Wire CreatePouchFlow into my App.jsx so it opens when the user taps
"Open a pouch" on the HomeScreen (which calls onCreatePouch). When
CreatePouchFlow's onComplete fires, add the returned pouch object to the pouches
array passed to HomeScreen.
```

Done.
